

Decision Support Tool: Real Time Data Sharing with Study Participants

This decision tool is intended to support trial designers, working in partnership with patients, determine whether outcomes data collected should be shared with study participants in real time via the digital technology. The questions are organized hierarchically to reflect the impact these issues may have on the safety, quality and feasibility of a typical study. However, this tool is not intended to be applicable to every trial, nor to be all-inclusive. CTTI recognizes that relative ranking of questions may vary according to the nature of the study and recommends that users freely adapt this tool to best meet their needs. For additional considerations pertaining to sharing data in real time, please reference [CTTI Recommendations for Managing Data](#).
