DIGITAL HEALTH TRIALS

Recommendations for Testing a Digital Health Technology

After you’ve selected the right technology for your trial, it’s critical to prepare it for use in the field. CTTI’s recommendations and resources help walk you through feasibility testing, verification, and validation processes.

RECOMMENDATIONS

1. Identify and conduct the necessary feasibility or pilot studies with sites and a representative patient population; studies conducted before full implementation of a large trial can help to reduce risk

2. Define and test processes for the implementation, operation, and maintenance of digital technologies in the field prior to launching the trial
